FreshTrack

The Idea

An AI system that predicts when food will expire and suggests meals to save it – helping thousands reduce food waste before it happens.

The Target

The primary beneficiaries are households that regularly purchase and store groceries, particularly students, shared households, busy professionals, and families who may forget about food stored in their fridge.
People living in shared accommodation or busy lifestyles often experience the highest levels of food waste because food management is uncoordinated or ingredients are forgotten.

What it Solves

Household food waste: Prevents ingredients from spoiling unnoticed.
Money loss: Saves users money by helping them use food before it expires.
Environmental impact: Reduces food sent to landfill and associated CO_2 emissions.
Meal planning friction: Provides recipe suggestions to make use of soon-to-expire food.
Shared household coordination: Alerts multiple users to avoid duplicate purchases.

How it works

We will develop a mobile app connected to a small fridge-mounted or smartphone camera. Computer vision will identify food items, and AI will predict spoilage based on type, storage duration, and visual cues. The system will send notifications and recipe suggestions to help users use food before it spoils. Cloud-based processing will track inventory, generate insights, and measure impact.
